

MEDIA HOLDING DEVICE

ABSTRACT OF THE DISCLOSURE

A media holding device for supporting media in an upright position comprising a vertical element and a horizontal extension element, created from a continuous length of rod stock formed into segments. The vertical element is a vertical plane defined by at least three corner points creating a geometric shape, for providing lateral support for the held media. The horizontal extension element extends from the vertical element perpendicularly to the vertical plane, creating a horizontal plane for supporting the vertical element.
